Author/Creator

[Herrera, Yuri, 1970-](#) author, writer of preface.

Contributor

[Dillman, Lisa,](#) translator.

Contents/Summary

Contents

- [Kingdom cons](#)
- [Signs preceding the end of the world](#)
- [The transmigration of bodies](#)

Summary

The Mexico we hear of in the news - the drug cartels, migration and senseless violence - is rich soil for Herrera's moving stories of people who live in this reality but also live in the timeless realm of myth, epic and fairy tale, such as the singer Lobo in Kingdom Cons who loves the drug lord's own daughter, Makina who crosses borders to find her brother in Signs Preceding the End of the World, and the Redeemer, a hard-boiled hero looking to broker peace between feuding families during a pandemic in The Transmigration of Bodies. These three novels get to the heart of the matter in a truly original way. They are storytelling that is at once timely and timeless.

Linked Data--Statements

Linked Data--Statements

- made up of statements, not records
 - in the form "subject--predicate--object" (a "triple")

Statements expressed as URIs

Señales que precederán al fin del mundo. English

is translation of

Señales que precederán al fin del mundo

<http://id.loc.gov/resources/hubs/cbb1f83c-13a0-dc73-d009-5e3363e6aa5e>

MARC vs Linked Data

MARC

Data elements are linked together by the context of the database record

Identifiers are text strings

Relationships are expressed in free text notes, or controlled text strings & require human interpretation

Not machine-readable or -actionable

Combines description of works, expressions, manifestations, events

MARC databases are silos—they cannot make use of outside metadata

Linked Data

Data elements are linked together as independent statements and not tied to a record format

Identifiers are URIs

Relationships are expressed as triples in the form of URIS

Triples are machine-actionable

Entity-based descriptions combined through relationships defined by an ontology

Links can be made to other linked data repositories

Between institutions & within shared print trusts

- true linking & clustering of resources with simple & complex relationships between works built into & explicitly defined by the metadata
 - title changes/merges/splits
 - alternate formats
 - work-based discovery clusters related resources for more meaningful display to users
 - clustering title changes, etc. allows for preservation of serial clusters, rather than individual titles (or maybe multiple editions of monographic works)
- possibility of item-based holdings, access information
- possibility of linking out to further information
 - conservation/preservation information
 - information about the shared print program

Between shared print trusts

- potential to connect pools of aggregated data in various shared print nodes
 - benefits for creating an overall picture of shared print, possibilities for resource-sharing (including objects, metadata, tools)
- potential for connecting local catalogs to shared print nodes
 - simplified resource sharing?
 - visibility, awareness
- open, reusable metadata that can be shared
